**RE:    Quarterly Air and Wipe Sampling – April 2017**  
**Sky Valley Educational Center, 351 Short Columbia Street, Monroe, Washington**

Dear Devlin:

On April 10 through 12, 2017 Fulcrum Environmental Consulting, Inc. (Fulcrum) completed a sampling event at Sky Valley Educational Center for the presence of polychlorinated biphenyls (PCBs) in air and on non-porous surface. The purpose of the sampling event was to evaluate all areas of the building from which PCB containing caulk was removed in 2016 as specified in Monroe School District's Corrective Action Plan, dated May 25, 2016. See Attachment A for site photographs of air sample location and Attachment B for site photographs of wipe sample locations.

### **Background**

In summer 2016, PCB-containing caulk and light fixtures were remediated at Sky Valley Educational Center in the Administration, Annex, Gymnasium, Classroom Pod/Library, and the Technology buildings. Following remediation samples were collected and analyzed to evaluate site conditions. In December 2016 the 1<sup>st</sup> quarter PCB sampling event was completed, which included collection of 50 air samples and 10 wipe samples. Seven samples and one field blank were identified with PCBs, including samples collected from Room F in the Annex Building; the Gathering Place – East, Small Gym, Girls Locker room, Girls Locker room Storage, and Electrical room of the Small Gym, and the CTE room of the Gym Building. All of the samples with detectable PCBs occurred sequential and at the end of the sampling process. As a results, the consultant concluded, following a review of the results and sampling media handling practices, that the sampling media was contaminated during the handling process and recommended that retesting be completed.

In March 2017, Fulcrum completed air and wipe sampling of select areas in SVEC, including each area where a sample with detectable PCBs were indented during the December 2016 event and four electrical rooms that had not been previously evaluated.

### **Scope of Work**

Fulcrum's scope of work consisted of the collection of air samples and wipe samples from select locations at Sky Valley Educational Center for the presence of PCBs and consisted of the following tasks:

- Collected 56 air samples for PCBs in air with each sample consisting of approximate 2,000 liters of air collected during a period of about 6.8 hours.
- Submitted collected air samples, three field blanks, and three laboratory blanks for analysis by U.S. Environmental Protection Agency (EPA) Method TO-10a to determine PCB content.
- Collected 12 wipe samples from non-porous surfaces with laboratory provided hexane wipe media.
- Collected two duplicate wipe samples from locations immediately adjacent to project samples non-porous surfaces with laboratory provided hexane wipe media.
- Submitted collected wipe samples, two duplicate samples, one field blank, and one laboratory blank for analysis by EPA Method 8082 to determine PCB content.
- Prepared this single summary letter report with the associated laboratory results and revised sample figures.

Fulcrum's services were provided to Monroe School District in evaluation of the Sky Valley Educational Center located at 351 Short Columbia Street in Monroe, Washington. Fulcrum's assessment did not include evaluation of non-readily accessible areas such as sealed wall cavities, beneath wall or floor coverings, etc. except those specifically identified in this report. Results are specific to the time and day of inspection and may not reflect conditions at other times.

### Sampling Event

Fulcrum's sampling event was completed in conformance with the Quality Assurance Project Plan (QAPP) prepared for the project.<sup>1</sup> See Attachment C for project figures.

All samples collected during the project were submitted to ALS Global in Cincinnati, Ohio (ALS-Cincinnati) for analysis. ALS-Cincinnati has been the project laboratory for much of the prior work within the building. ALS-Cincinnati also provided all sampling media used during the project. All samples submitted to ALS-Cincinnati were submitted under chains-of-custody and delivered by commercial carrier in an insulated cooler with reusable freezer packets. See Attachment D for ALS-Cincinnati laboratory results and chains-of-custody for all air samples. See Attachment E for ALS-Cincinnati laboratory results and the chain-of-custody for project wipe samples.

Samples were submitted on the day of sample collection and were received by ALS-Cincinnati under four separate chains-of custody. The associated ALS-Cincinnati work orders are 1704300, 174352, 1704391, and 1704401.

### Air Sampling

Air sampling was completed as described in EPA Method TO-10a.<sup>2</sup> Sampling utilized a polyurethane foam (PUF) sample media in a borosilicate glass cassette. Air is pulled through the PUF filter by an air pump which is connected by clear Tygon-type tubing.

Flow calibration was measured both before and after sample collection by a TSI 4046 primary calibrator. The primary calibrator was factory calibrated in January 2017. Samples were collected at a rate of 5 liters per minute (LPM) and ranged from 2,050 to 2,100 liters (L) of total sampling volume.

### Wipe Sampling

All wipe samples were collected with laboratory provided hexane saturated cotton gauze, stored in 2-ounce borosilicate glass jars. Wipe samples were preferentially collected from either staining on a transformer(s) present within the area or from the area of the underlying flooring with the most dust accumulation. See Attachment B for site photographs of wipe sample locations.

Each wipe was collected from the substrate surface within a disposable paper template that measured 10 centimeters (cm) by 10 cm, for a total area of 100 square cm (cm<sup>2</sup>). Each individual wipe was returned to the sampling jar immediately following sample collection.

All samples were collected from the surface of the epoxy sealant present on the substrate. Substrate materials included brick, concrete, metal, plaster, or laminate and was present on walls, door or window frames, or overhead beams.

### Sampling Discrepancies

The following sampling discrepancies occurred during the sampling event:

- Two excess wipe samples were inadvertently collected from the incorrect locations as a results of room number confusion. The samples were submitted along with other project samples but were held and were not analyzes.

### Laboratory Results

ALS-Cincinnati completed analysis of samples collected during this project. Air samples were submitted under three separate chains-of-custody and were processed as three separate batches as 1704300, 1704391, and 1704352. The laboratory reports for the air samples are included in Attachment C. Wipe samples were submitted under one chain-of-custody and were identified by ALS-Cincinnati as batch 1704401. See Attachment D for the laboratory report for project wipe samples.

Laboratory analysis did not identify any airborne PCBs within the samples collected and analyzed during this event. All method reporting limits were significantly below the EPA regulatory threshold for PCBs in air of 100 nanograms per cubic meter (ng/m<sup>3</sup>) of air.

No PCB concentrations were identified at any of the wipe sampling locations. All method reporting limits were significantly below the EPA regulatory threshold for PCBs on building surfaces.

#### Analytical Discrepancies

ALS-Cincinnati reported the following discrepancies occurred during laboratory analysis:

- 1704300 – The method reporting limit ranged from 0.10 micrograms per sample (µg/sample) to 5 µg/sample within the sample batch. As a result, the highest “non-detect” result was at 2.4 ng/m<sup>3</sup> which is well below the action level of 10 ng/m<sup>3</sup>. No detectable concentrations of PCBs were present in any

of the collected samples. The field blank and laboratory blank both reported non-detected concentrations of PCBs at the method reporting limit.

- 1704352 – No discrepancies or errors were reported for the sample batch. All method reporting limits were sufficient to meet project data quality objectives. The field blank and laboratory blank both reported non-detected concentrations of PCBs at the method reporting limit.
- 1704391 – No discrepancies or analytical errors were reported by ALS-Cincinnati. Fulcrum noted that sample 41217-POD-RM11 has a method reporting limit that was higher than other samples in the set; however, the reporting limit was low enough to demonstrate that PCBs were not present at a concentration well below the project action level. The field blank and laboratory blank both reported non-detected concentrations of PCBs at the method reporting limit.
- 1704401 – No discrepancies or errors were reported for the sample batch. All method reporting limits were sufficient to meet project data quality objectives. The field blank and laboratory blank both reported non-detected concentrations of PCBs at the method reporting limit.

All sample results and laboratory quality control documentation was reviewed. All analysis met the project quality control criteria and produced reliable results that would have identified PCBs at the applicable action level.

### Conclusions & Recommendations

No PCBs were reported at the method reporting limits in any of the air or wipe samples collected and submitted for analysis. Based on the results of the wipe testing, the selected epoxy paint is effectively encapsulating the remnant PCB contamination that is within the porous substrate materials. No airborne PCB hazards were found to be present in the building.
